                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [11] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, dermatological, cytostatic, antiseborrheic, antidiabetic, antisickling, ophthalmological, cytokine involved in inflammation. [1] can be used in gene therapy. [4] and [11] are useful for treating proliferative skin diseases such as psoriasis, actopic dermatilis, actinic keratosis, skin diseases such as psoriasis, actopic dermatilis, actinic keratosis, skin diseases such as psoriasis, actopic dermatilis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, estinopathy compathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and scarring such as keloid, adhesion and hypertrophic or hypertrophic burn and scarring such as keloid, adhesion and sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                               This 5' primer corresponds to nucleotides 809-830 of the chicken matrix metalloproteinase-2 (chMMP-2) mature polypeptide coding region (see AAV03995). It was used with a 3' primer (see AAV03996) to amplify a portion of coding region encoding amino acids to amplify a portion of coding region encoding amino acids BamHI site allowing directional ligation of the amplified product into poex-llambdar or personal ligation of the amplified product into poex-llambdar or personal response as a fusion protein with glutathione-5-transferase in E. coli transformants. The invention relates to the discovery that angiogenesis is mediated by the specific vitronectin receptor alpha-v beta-3, and that inhibition of alpha-v beta-3 function inhibits angiogenesis. Claimed antagonists of alpha-v beta-3 include C-terminal fragments (see AAV1083-94) of human or chicken WMP-2 and fusion proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  5' PCR primer used to obtain cDNA encoding chicken MMP-2 fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Metalloprotease-2; MMP-2; alpha-v-beta-5 antagonist; treatment; vitronectin receptor; inhibition; angiogenesis; tumour growth; restenosis; neovascularisation; PCR primer; ss.

describes a novel labelled package that contains an inhibitor of alpha-v-beta-5 can inhibit angiogenesis. The specification describes a novel labelled package that contains an inhibitor of angiogenesis.e. an alpha-v-beta-5 antagonising polypeptide that binds to integrin alpha-v-beta-5 and includes a part of the C-terminal domain of MMP-2. The antagonists are used to inhibit angiogenesis in inflamed tissurders (e.g. diabetic or other forms of retinopathy, neovascular glaucoma, or corneal transplants). They are particularly used to induce regression or to inhibit growth of tumours. The alpha-v-beta-5 antagonists can also be used to treat restenosis caused by migration of smooth muscle cells following angioplasty and to reduce blood supply to selected tissues. The antagonists particularly inhibit checked the inhibit growth factor alpha, epidermal growth factor or especially vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                               PCR primers AAV12874-78 were used, together with AAV12873 as the 3'
primer, to obtain cDNA encoding chicken matrix metalloproteasse-2 (MMP-2)
protein fragments (AAW4124-19). Fragments of the MMP-2 protein act as
alpha-v-beta-5 antagonists. Alpha-v-beta-5 is a vitronectin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; variant thrombospondin 1; variant thrombospondin 4; SNP; polymorphism; vascular disease; coronary artery disease; forensics; myocardial infarction; atherosclerosis; stroke; venous thromboembolism; pulmonary embolism; paternity test; ds.

                                                                                                                                                                                                                                                                                                             The present invention provides a method of diagnosing a vascular disease in an individual; involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 9 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclerosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism and pulmonary embolism. Single nucleotide polymorphisms (SNPs) are also useful in forensics, paternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of
                                                                                                                                                                               Nucleic acids comprising single nucleotide polymorphisms, useful in applications such as forensics, paternity testing, medicine, genetic analysis and phenotype correlations to diseases such as diabetes and

AAT50138-T50359 represent target sequences for the rabbit cholesterol ester transfer protein (CETP) hammerhead (HH) ribozymes (see AAT500138-T5046). CETP is a 74 kD glycoprotein that facilitates neutral lipid transfer between plasma lipoproteins. The numbering of the targets refers to the position of the cleavage site in full length CETP. The cribozymes are able to cleave mRNA from the gene encoding CETP. The ribozymes are able to cleave mRNA from the gene encoding CETP, thereby blocking synthesis and/or expression of the mRNA. By inhibiting CETP, the reverse cholesterol transport (RCT) pathway can be inhibited (or climinated) thereby preventing the reduction in size density of the high density lipoproteins (HDI), prolonging HDL half life, and therefore increasing HDL levels. The ribozymes can be used to treat conditions associated with abnormal levels of CETP, specifically atherosclerosis, familial hypercholesterolaemia, peripheral vascular disease, dyslipidaemia, hyperbetalipoproteinaemia, hypoalphalipoproteinaemia, cwarular complications of diabetes, transplant, atherectomy and angioplastic restenosis. By inhibiting CETP, the levels of HDL and low density lipoproteins (LDL), and the HDL:LDL ratio are favourably altered (a decrease in LDL levels, and to detect CETP mRNA. As the HH consider in diseased calls, and to detect CETP mRNA. As the HH considering the consisting of the CETP gene, they have low
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

called macaca mulatta rhadinovirus 17577 (RRV). AAC64754 represents the RRV genome sequence. The present invention also specifically claims the individual open readinovirus 17577 (RRV). AAC64754 represents the RRV genome sequence. The present invention also specifically claims the individual open reading frame (ORF) nucleotide sequences from the genome which encode the individual proteins, but these sequences are not given. A non-human animal infected with RRV can be used for testing the efficacy of drug in the treatment of condition associated with infection with RRV such as Raposi's sarcoma, lymphoproliferative infection with RRV such as Raposi's sarcoma, lymphoproliferative disorders, B-cell hyperplasa, lymphadenopathy, splenomegaly, hypergammaglobinulinaemia or autoimmune haemolytic anaemia by administering the drug to a immuno-compromised non-human primate model for a immuno-compromised non-human primate model for testing potential treatments for conditions associated with RRV infection. It is also useful for testing the subject with RRV infection by administering the vaccine to the subject capable of infection with RRV, inoculating the subject with RRV and one of the subject of vaccine. AAC64755 to AAC64765 and AAB53205 to AAB53213 represent sequence used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PCR primer, human, ACE, angiotensin converting enzyme, angiotensinogen, cardiovascular status, AGT, AT1, type 1 angiotensin II receptor; stroke, polymorphic pattern; blood pressure; electrocardiographic profile, cardiac condition diagnosis; myocardial infarction; atherosclerosis; hypertension; cardiovascular disease; ss.
                                                                                                               New rhesus rhadino virus for producing non-human primate model useful for testing potential treatments and efficacy of the candidate vaccine for conditions associated with RRV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

angiotensin Corollary (margine), and (margine) and (margine) and (margine) and (margine) and comparing the polymorphic pattern used to assess blood pressure or electrocardiographic profile, to diagnose a cardiac condition such as (silent) myocardial infarction (MI) hypertension, atherosclerosis or stroke. They can also be used to predict antagonists to treatments with ACE inhibitors, angiotensin II receptor antagonists, diuretics, alpha-or beta-adrenergic receptor antagonists, etc. It is also used to identify susceptibility to cardiovascular disease. Libraries of mucleic acids containing polymorphic positions in the 3 genes, and libraries of targets corresponding to the peptides from the genes are used to screen for cardiovascular agents. The nucleic acids contained in the library can be is used as source of
                                                                                                                                                                                                                                       This sequence represents a PCR primer for the human ACE (angiotensin converting enzyme) gene, and can be used in the method of the invention. The method is for assessing cardiovascular status in humans by determining the sequence of at least one polymorphic site in the ACE (angiotensin converting enzyme), AGT (angiotensingen) and/or ATI (type 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                     Assessing cardiovascular status in humans by polymorphic analysis of genes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human ACE, AGT and AT1 genes polymorphisms PCR primer SEQ ID NO: 38

Assessing disease status in individual by determining sequence(s) at one or more polymorphic positions within the human genes encoding the protein(s) involved in physiological pathway associated with treatment
WPI; 2000-638268/61.
```

Example 1; Page 57; 141pp; English.

polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THe PCR primers shown in sequences AACG1201-C61371 were all used to demonstrate the The present invention is related to methods for determining the methods of the invention.

Norberg LT, Andersson MK,

Assessing cardiovascular status in humans involves comparing test polymorphic pattern comprising polymorphic positions within genes encoding specific proteins, with reference polymorphic pattern WPI; 2000-318010/27.

Lindstrom PHR, Jonsson L;

Example 1; Page 49; 126pp; English.

The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACB), angiotensin II receptor type 1 (ATI) and type 2 (AT2), angiotensinogen (AGT), renin, aldosterone synthase, endothelin receptor type A and beta-adrenergic 

correspondence and 2. The method comprises determining the sequence at one pattern of polymorphic positions within these genes, and comparing the pattern of polymorphic positions within these genes, and comparing the pattern obtained from a population of individuals exhibiting a predetermined cardiovascular disease status. The polymorphic markers cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular diseases as myocardial infarction, unstable angina, therefore a morphic marker and stroke. They are also useful for predicting the likely cardiovascular status of a patient given a cardiovascular cardiovascular status of a patient given a cardiovascular cardiovascular days.

CC predicting the likely cardiovascular status of a reatment regimen comprising administration of cardiovascular days.

CC predicting the outcome of a treatment regimen.

CC primers and probes for detecting genetic polymorphic markers by provides a basis for detecting genetic polymorphic site may be used as provides they encode are useful in the screening of potential cardiovascular days. Determination of an individual splaymorphic cardiovascular days. Determination of an individual splaymorphic cardiovascular days. Determination of an individual splaymorphic cardiovascular patient. It also provides the ability to eliminate priminates trial and error in selecting a treatment coil mane particular individual cardiovascular patient. It also provides to cardiovascular patients from climinate baring can be evaluated to cardiovascular patients regimen. Adverse results in an early trial can be evaluated to cardiorate with a sub-populations from the treatment group. Beneficial cardiovascular patients required for a climinate baring the number of patients required for a climinate of patients required for a climinate of patients required for a climinate of patients required for a climinate of patients required for a climinate of patients required for a climinate of patients ö The method comprises determining the sequence at one Gaps 0, 59.0%; Score 12.4; DB 21; Length 19; 92.9%; Pred.
